

The Apollo Program:

- 6 lunar landing missions
- 11 crewed missions
- Two different boosters were selected for the program including Saturn IB for Earth orbits and ... - - - - - for its lunar flights
- Apollo was a three-part spacecraft

International Space Station (ISS):

- 25 years in orbit (As of November 2, 2025)
- **Fun fact** that still blows my mind: it's a shorter flight to get to the ISS than it is from Perth to Sydney
- 280 + Astronauts have visited
- Designed between 1984 and 1993
- Expedition 74 started on the 8th December 2025

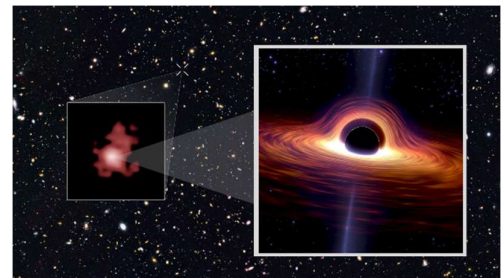

Mars Rovers - Perseverance:

- Launched 30th of July 2020 on rocket - - - - -
Landing on Mars on the 18th of February 2021
- **Fun fact:** The challenge creator has their name etched on the silicon chip attached to Perseverance and another name tag aboard Artemis II which orbited the moon with Christina, Reid, Jeremy and Victor in early 2026
- Other rovers include Sojourner (1997), Spirit and Opportunity (2004) and Curiosity (2012)
- Target was Jezero Crater

James Webb Space Telescope and Hubble Space Telescope:

- Launched 25th December 2021 (J.W)
- Launched 24th of April 1990 (Hubble)
- It doesn't orbit Earth like Hubble Space Telescope rather it orbits the sun 1.6 million kilometres away
- Fun fact that still blows my mind: the Hubble Space Telescope is closer to Earth than Perth is to Sydney (look it up if you don't believe me).
- NASA's Webb has found the strongest evidence yet for 'black hole stars'
- Hubble has celebrated 36 years in space

Artemis II:

- Launched on the 1st April 2026
- Splashdown on the 10th April 2026
- The --- .-. .. --- -. Spacecraft was nicknamed Integrity by the crew and named a crater 'Integrity' in honour of the spacecraft for giving them safe passage beyond Earth's low orbit for the first time in 50 years (since Apollo 17 in 1972)
- Another crater was also named Carroll by the crew
- NASA's SLS (Space Launch System) which can send --- .-. .. --- -. Astronauts and cargo directly to the moon in a single launch.

Nancy Grace Roman Space Telescope

- Completed on the 25th November 2025
- Planned launch: 30th of August 2026
- A view at least 100 times larger than Hubble's
